

Torch (TFG)

Application:

Graphite absorbs moisture. Ignite the propane torch and dry out the inside of the mold thoroughly on both sides, heating the mold to approximately 120 degrees Celsius. The conductors should be clean and dry before the connection is made. Use torch to dry wire conductors and remove remaining cleaning residue, solvent, or water before making the "PetWeld" connection.

Structure Outline:

Specification:

This brass burn tip torch is for use with standard 190g pierceable gas canister.
